**<u>Internal cold food temperatures should not be over 41°F</u>**

**Freezer Temperature should be 0°F or below**

→35° to 38° F is ideal air temperature for most refrigeration, but lower temperature increases shelf life of foods.

Remember the food temperature will always be higher than the air temperature in the cooler

(Example: If the air temperature is 38°F, your internal food temperature might be 40°F)
